Understanding the connectivity of Raspberry Pi board with X-bee module. Writing a network application for communication between two devices using X-bee

Objectives:

- To study how to interface X-bee with Raspberry Pi
- To study wireless communication using two X-bees

Software:

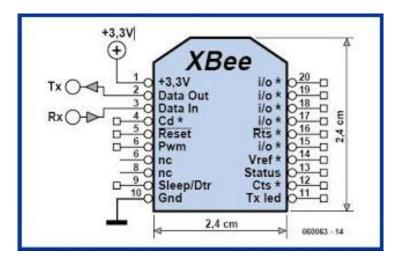

- Raspberry OS,
- IDLE IDE for Python
- XCTU for configuring X-bee

Hardware Modules:

- Raspberry pi
- Two X-bee modules
- FRC cable

Theory:

- X-Bee is a low-power wireless mesh network standard, operating in the 2.4 GHz range.
- XBee is not same as ZigBee—instead, XBee is a brand of radio communication modules (made byDigi) that can support a number of protocols, including ZigBee, 802.15.4, WiFi, etc.
- Its range is 10 to 100 meters.
- X-Bee is often used in home automation products, though it is not the only option.

Configuration of X-bee modules:

To establish communication between two X-bees, they need to configure.

Step 1:

• To configure XBee module, connect XBee Explorer shield to a computer via USB.

Fig. 1: XBee Explorer shield

Step 2:

Here we set the Channel, PAN ID, and Address values for the X-bee

Channel:

- The channel calibrates the operating frequency within the 2.4GHz 802.15.4 band.
- The XBees must be on the same channel to communicate with one another.

PAN ID (Personal Area Network ID):

• The X-Bees must share the same PAN ID to communicate with one another. You can choose a value between 0 and 0xFFFF.

Addressing:

- Each X-Bee has a Source address (referred to as "MY address") and a Destination address (which has an upper half, Destination High or DH, and a lower half, Destination Low or DL).
- The XBee's destination address specifies to which source address it can send data.
- You can specify a universally unique address by using the 64-bit address printed on the back of the module, use a shorter 16-bit address (unique within a network), or use a string of text (e.g., "Alice's radio").

Additionally, each XBee in a network plays one of the following roles,

Coordinator:

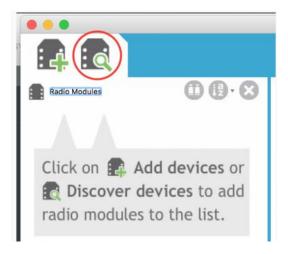

• Each network has exactly one Coordinator, which serves as the root of the network tree.

Router:

• A network can have multiple Routers; these can forward information to end devices and also run application functions.

Steps to configure the X-bee

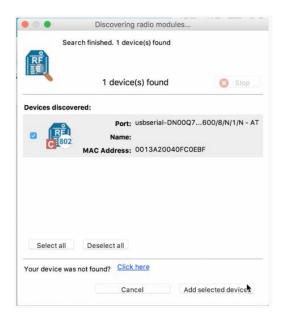

- Download and install XCTU. It is available for both Windows and Mac.
- Plug first XBee into an Explorer module, and connect it to computer's USB port via a USB cable.
- Open XCTU and click "Discover devices."

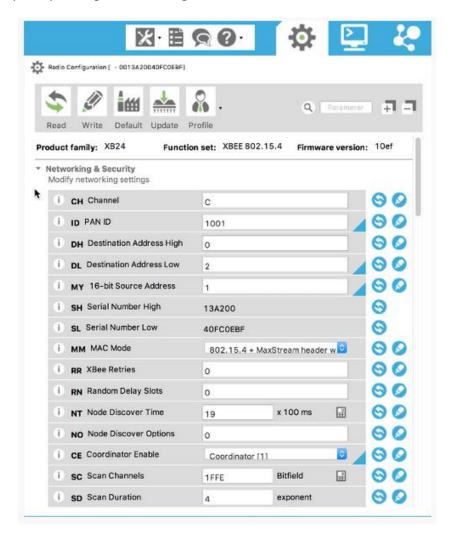

Select the port to be scanned. Then on the next page, select the settings as shown below.
 Click "Finish."

- Your device should appear on the "Devices discovered" list.
- Click "Add selected devices" for your module.

- With the Gear icon selected, click the radio module in the left-hand menu.
- This should open up a long list of settings.

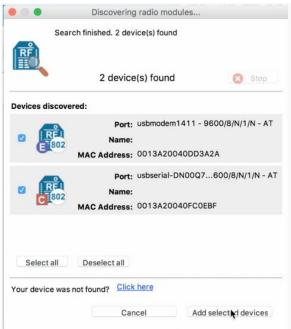

- We can set the X-bee as Coordinator or Router.
- Plug the first X-bee on the Explorer. Set the first X-bee as Coordinator and do the settings as per given in the below table.
- Now unplug the first X-bee and plug the second X-bee on the Explorer. Set the second X-bee as Router and do the settings as per given in the below table.

	Co-ordinator	Router
	X-bee-1	X-bee-2
DH	0	0
DL	FFFF	0
PAN ID	1234	1234
JV channel verification	Disable	Enable
CE Coordinator Enable	Enable	Disable

After you've made all your changes, click "Write."

Run the Communication Test

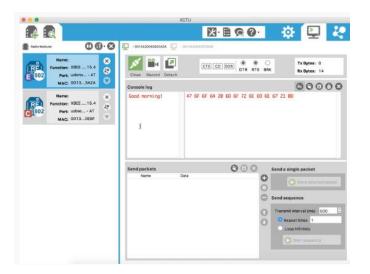

- Plug one XBee (on its Explorer module) into a USB port (via USB cable).
- Plug the other XBee (on its Explorer module) into another USB port.
- In XCTU, scan for devices. You should see both devices available.
- Select both of them and click "Add selected devices."

• Click one of the modules in the left-hand column. Now select the Console icon to view the console. Click "Open."

- Repeat for the other module, opening up a console.
- Type some text in one of the console. You should see the result echoed back in the other console.

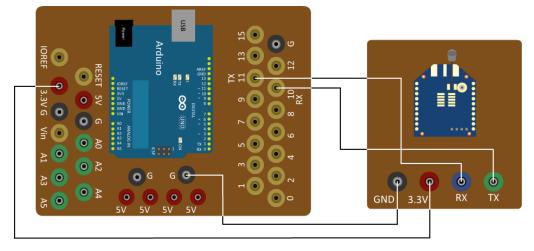

Safety precautions:

- Raspberry-Pi provides 3.3V and 5V VCC pins
- Raspberry-Pi operates on 3.3V.
- Various sensors and actuators operate on different voltages.
- Read datasheet of a given sensor or an actuator and then use appropriate VCC pin to connect a sensor or an actuator.
- Ensure that signal voltage coming to the Raspberry-Pi from any sensor or actuator does not exceed 3.3V.
- If signal/data coming to Raspberry-Pi is greater than 3.3V then use voltage level shifter module to decrease the incoming voltage.
- The Raspberry-Pi is a costly device, hence you should show the circuit connections to your instructor before starting your experiment.

Set Up Your Circuits

For Arduino:

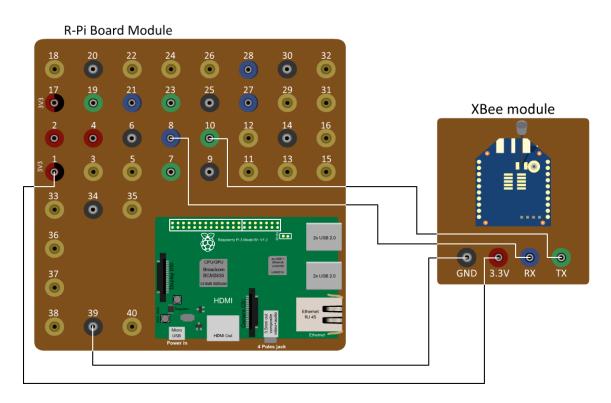

- We will connect one X-bee to Arduino Microcontroller.
- This will act as sender
- The interfacing diagram of X-bee with Arduino is as shown below

Connections with Arduino-

Arduino Pins	X-bee Pins
10	Data Out (Pin-2) (Tx)
11	Data In (Pin-3) (Rx)
3.3v	Vcc or 3.3v (Pin-1)
G	Gnd(Pin-10)

For Raspberry Pi:

Steps for assembling the circuit:

R-Pi-3 Pins	X-bee Pins
10	Data Out (Pin-2) (Tx)
8	Data In (Pin-3) (Rx)
3.3v	Vcc or 3.3v (Pin-1)
G	Gnd(Pin-10)

Procedure:

- Write the program as per the algorithm given below.
- Save program.
- Run using run module

How to enable UART port:

Step 1:

• In Raspberry Pi, enter following command in Terminal window to enable UART,

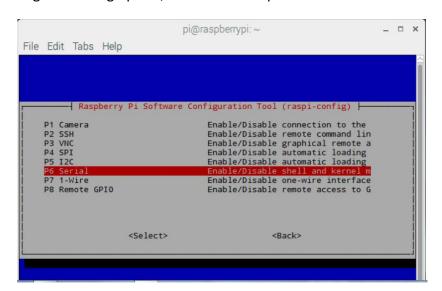

Step 2:

Select -> Interfacing Options

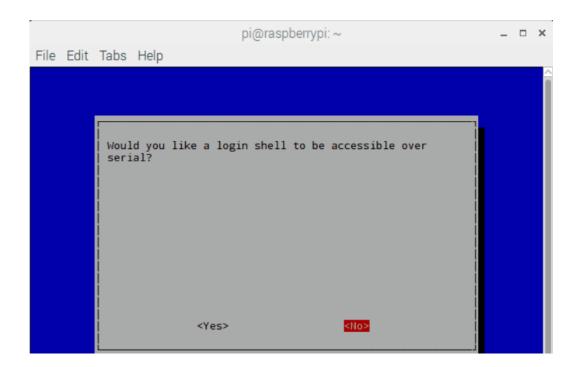

Step 3:

After selecting Interfacing option, select Serial option to enable UART

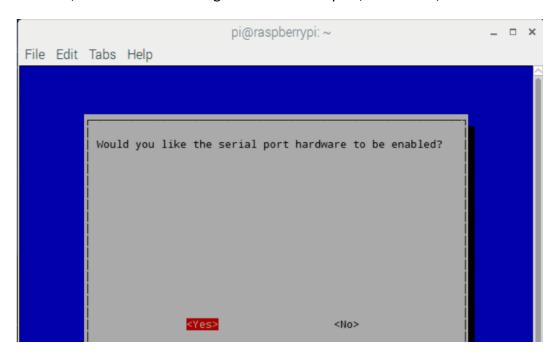

Step 4:

• Then it will ask for login shell to be accessible over Serial, select **No** shown as follows.

Step 5:

• At the end, it will ask for enabling Hardware Serial port, select Yes,

Step 6:

• Finally, our UART is enabled for Serial Communication on RX and TX pin of R-Pi-3

Step 7:

- Then, reboot the Raspberry Pi.
- Sudo reboot

Step 8:

- To check UART mapping, enter following commands.
- Enter command,

The UART mapping for /dev/ttyS0 and /dev/ttyAMA0 is shown below,

```

Study of different CPU Frequency Governors. Writing an application to change CPU frequency of Raspberry-Pi board

Aim/Objectives:

• To understand the concept of CPU Frequency Governance

CPU Frequency Governor

- The governor defines the power characteristics of the system CPU, which in turn affects CPU performance.
- Each governor has its own unique behavior, purpose, and suitability in terms of workload.

Types of CPU Frequency Governors:

Performance:

- The Performance governor forces the CPU to use the highest possible clock frequency.
- Clock frequency will be statically set, and will not change.
- No power saving benefit.
- Only suitable for hours of heavy workload

Power Save:

- The Power-save governor forces the CPU to use the lowest possible clock frequency.
- Clock frequency will be statically set, and will not change.
- This governor offers maximum power savings, but at the lowest CPU performance.

On-Demand:

- The On-Demand governor is a dynamic governor that allows the CPU
 - a. To achieve maximum clock frequency when system load is high, and
 - b. To achieve minimum clock frequency when the system is idle

User Space:

• The Userspace governor allows the user to set the CPU frequency for User programs.

CPU Frequency of Raspberry Pi 3:

- Minimum CPU frequency: 700 MHz
- Maximum CPU frequency: 1200 MHz (1.2 GHz)
- Raspberry pi 3 having On-Demand CPU Frequency Governor

Steps to change the CPU Frequency of Raspberry Pi 3:

- For changing cpu frequency of Raspberry Pi 3 we know the current frequency of Raspberry Pi-3
- Open the LX-Terminal of Raspberry Pi-3
- Type the following command cat /sys/devices/system/cpu/cpu0/cpufreq/scaling_cur_freq
- Press Enter key
- You will get the current speed in kHz.
- Divide this speed by 1000 to get in MHz.

- For changing current cpu frequency open config.txt file using following command sudo nano /boot/config.txt
- Press Enter key
- It will open the configuration file
- Uncomment the arm_freq and change its value (Not more than 1200) because CPU frequency of Raspberry pi 3 is minimum 700 MHz and Maximum 1.2 GHz.
- Then press Ctrl+O and then enter for writing the changes in file.
- Open the LX-Terminal in Raspberry pi-3
- Reboot Raspberry pi using following command sudo reboot
- After Restarting Raspberry Pi 3 open LX-Terminal and check the current frequency of Raspberry Pi 3 using step 3.
